REQUENCE FROM N.A.

RA Gilles A., Lecointre G.;

Ra dilles A., Lecointre G.;

Ra dilles A., Lecointre G.;

Ra maner accurate phylogeny of european cyprinids based on the mitochondrial control region.";

Rubmitted (JUN-1999) to the EMBL/GenBank/DDBJ databases.

C. EUNCTION: COMPONENT OF THE UBIQUINOL-CYTOCHROME C REDUCTASE COMPLEX III OR CYTOCHROME B.-C1 COMPLEX), WHICH IS A RESPIRATORY CHAIN THAT GENERATES AN ELECTROCHEMICAL POTENTIAL COUPLED TO ATP SYNTHESIS (BY SIMILARITY).

C. COUPLED TO ATP SYNTHESIS (BY SIMILARITY).

C. C. SUBDINIT: THE MAIN SUBUNITS OF COMPLEX B.-C1 ARE: CYTOCHROME B, CYTOCHROME C1 AND THE RIBSKE PROTEIN (BY SIMILARITY).

C. C. SUBUNIT: THE MAIN SUBUNITS OF COMPLEX B.-C1 ARE: CYTOCHROME B, CYTOCHROME C1 AND THE RIBSKE PROTEIN (BY SIMILARITY).

C. C. SUBUNIT: THE MAIN SUBUNITS OF COMPLEX B.-C1 ARE: CYTOCHROME B, CYTOCHROME C1 AND THE RIBSKE PROTEIN (BY SIMILARITY).

C. C. SUBUNIT: THE MAIN SUBUNITS OF COMPLEX B.-C1 ARE: CYTOCHROME B, CANDONS C1 C1 AND THE RIBSKE PROTEIN (BY SIMILARITY).

C. C. SUBUNIT: THE MAIN SUBUNITS OF COMPLEX B.-C1 ARE: CYTOCHROME B, CANDONS C1 C1 AND THE RIBSKE PROTEIN (BY SIMILARITY).

C. C. SUBUNIT: THE MAIN SUBUNITS OF COMPLEX B.-C1 ARE: CYTOCHROME B, CANDONS C1 C1 AND THE RIBSKE PROTEIN (BY SIMILARITY).

C. C. CORPLEX CANDONS C1 AND THE RIBSKE PROTEIN (BY SIMILARITY).

C. C. CORPLEX CANDONS C1 AND THE RIBSKE PROTEIN (BY SIMILARITY).

C. C. CORPLEX CANDONS C1 AND THE RIBSKE PROTEIN (BY SIMILARITY).

C. C. CORPLEX CANDONS C1 AND THE RIBSKE PROTEIN (BY SIMILARITY).

C. C. CORPLEX CANDONS C1 AND THE RIBSKE PROTEIN (BY SIMILARITY).

C. C. CORPLEX CANDONS C1 AND THE RIBSKE CANDONS C1 AND THE CYTOCHROME B FAMILY.

Copeia 2000:1019-1028(2000).

-!- FUNCTION: COMPONENT OF THE UBIQUINOL-CYTOCHROME C REDUCTASE

-:- FUNCTION: COMPLEX III OR CYTOCHROME B-C1 COMPLEX), WHICH IS A
RESPIRATORY CHAIN THAT GENERATES AN ELECTROCHEMICAL POTENTIAL

COMPLED TO ATP SYMTHESIS (BY SIMILARITY).

-!- COFACTOR: TWO HENE GROUDS (BS62 AND BS66) WHICH ARE NOT COVALENTLY
BOUND TO THE PROTEIN (BY SIMILARITY).

-!- SUBDUIT: THE MAIN SUBUNITS OF COMPLEX B-C1 ARE: CYTOCHROME B,
CYTOCHROME CI AND THE RIESKE PROTEIN (BY SIMILARITY).

-!- SIMILARITY: BELONGS TO THE CYTOCHROWE B FAMILY.

C. 1- FUNCTION: COMPONENT OF THE UBIQUINOL-CYTOCHROME C REDUCTASE
COMPLEX (COMPLEX III OR CYTOCHROME B-C1 COMPLEX), WHICH IS A
RESPIRATORY CHAIN THAT GENERATES AN ELECTROCHEMICAL POTENTIAL
COUPLED TO AFP SYNTHESIS (BY SIMILARITY).

C. 1- COPACTOR: TWO HEME GROUPS (BS62 AND B566) WHICH ARE NOT COVALENTLY
BOUND TO THE PROTEIN (BY SIMILARITY).

C. 1- SIBMILT: THE MAIN SUBBUNITS OF COMPLEX B-C1 ARE: CYTOCHROME B,
CYTOCHROME C1 AND THE RIESKE PROTEIN (BY SIMILARITY).

C. 1- SIMILARITY: BELONGS TO THE CYTOCHROME B FAMILY.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     -i- FUNCTION: COMPONENT OF THE UBIQUINOL-CYTOCHROME C REDUCTASE
COMPLEX (COMPLEX III OR CYTOCHROME B-C1 COMPLEX), WHICH IS A
RESPIRATORY CHAIN THAT GENERATES AN ELECTROCHEMICAL POTENTIAL
COUPLED TO ATP SYNTHESIS (BY SIMILARITY).
-i- COFACTOR: TWO HEME GROUPS (BS62 AND BS66) WHICH ARE NOT COVALENTLY
BOUND TO THE PROTEIN (BY SIMILARITY).
-i- SUBUNIT: THE MAIN SUBUNITS OF COMPLEX B-C1 ARE: CYTOCHROME B,
CYTOCHROME C1 AND THE RIESKE PROTEIN (BY SIMILARITY).
-i- SIMILARITY: BELONGS TO THE CYTOCHROME B FAMILY.
-i- SIMILARITY: AAPOLOGO 1.;
--- SIMILARITY: ABOLOGO 1.;

                                     COUPLED TO THE NATIONAL OF STATEMENTS OF STATEMENTY).

C. !- COFACTOR: TWO HENE GROUPS (B562 AND B566) WHICH ARE NOT COVALEN BOUND TO THE PROTEIN (BY SIMILARITY).

C. !- SUBBALT: THE MAIN SUBBALTS OF COMPLEX B-C1 ARE: CYTOCHROME B, CYTOCHROME C1 AND THE RIESKE PROTEIN (BY SIMILARITY).

C. !- SIMILARITY: BELONGS TO THE CYTOCHROME B FAMILY.

EMBL, AF177947; AAF00994.1; -- CATOCHROME B FAMILY.

-!- FUNCTION! COMPURENT OF THE UBIQUINOL-CYTOCHROME C REDUCTASE
COMPLEX (COMPLEX III OR CYTOCHROME B-C1 COMPLEX), WHICH IS A
RESPIRATORY CHAIN THAT GENERATES AN ELECTROCHEMICAL POTENTIAL
COUNDED TO APP SYNTHESIS (BY SIMILARITY).

-!- COFACTOR: TWO HEME GROUDS (1856 AND 8566) WHICH ARE NOT COVALENTLY
BOUND TO THE PROTEIN (BY SIMILARITY).

-!- SUBLUIT: THE MAIN SUBDATIS OF COMPLEX B-C. TARE: CYTOCHROME B,
CYTOCHROME C1 AND THE RIESKE PROTEIN (BY SIMILARITY).

-!- SIMILARITY: BELONGS TO THE CYTOCHROME B FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Electron transport; Heme; Respiratory chain; Transmembrane; Transport;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         BOUND TO THE PROTEIN (BY SIMILARITY).

-!-SUBUNIT: THE MAIN SUBUNITS OF COMPLEX B-C1 ARE: CYTOCHROME B, CYTOCHROME C1 AND THE RIESKE PROTEIN (BY SIMILARITY).

-!-SIMILARITY: BELONGS TO THE CYTOCHROME B FAMILY.

COMPLEX (COMPLEX II OR CYTCCHROME B-C1 COMPLEX), WHICH IS A
RESPIRATORY CHAIN THAT GENERATES AN ELECTROCHEMICAL POTENTIAL
COUPLED TO ATP SYNWHESIS (BY SIMILARITY).

C. 1- COPACTOR: TWO HEME GROUPS (BS62 AND B566) WHICH ARE NOT COVALENTLY
BOUND TO THE PROTEIN (BY SIMILARITY).

C. 1- SUBUNIT: THE MAIN SUBUNITS OF COMPLEX B-C1 ARE: CYTOCHROME B,
C. 1- SIMILARITY: BELONGS TO THE CYTOCHROME B FAMILY.

COUPLEX (COMPLEX III OR CYTOCHROME C REDUCTASE
COMPLEX (COMPLEX III OR CYTOCHROME B-C1 COMPLEX), WHICH IS A

RESPIRATORY CHAIN THAT GENERATES AN ELECTROCHEMICAL POTENTIAL

COUPLED TO ATP SYNTHESIS (BS SIMILARITY).

COUPLED TO THE PROTEIN (BY SIMILARITY).

COUPLEX COMPLEX BELONGS TO THE RIESER PROTEIN (BY SIMILARITY).

CYTOCHROME C1 AND THE RIESER PROTEIN (BY SIMILARITY).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              BOUND TO THE PROTEIN (BY SIMILARITY).

-!- SUBUNIT: THE MAIN SUBUNITS OF COMPLEX B-C1 ARE: CYTOCHROME CTYOCHROME C1 AND THE RIESKE PROTEIN (BY SIMILARITY).

-!- SIMILARITY: BELONGS TO THE CYTOCHROME B FAMILY.

11. MOL. Biol. Evol. 14:883-891(1997).

12. FUNCTION: COMPONENT OF THE UBIQUINOL-CYTOCHROME C REDUCTASE
COMPLEX (COMPLEX III OR CYTOCHROME B.C. COMPLEX), WHICH IS A
RESPIRATORY CHAIN THAT GENERATES WELCTROCHEMICAL POTENTIAL
COUPLED TO ATP SYNTHESIS (BY SIMILARITY).

12. COUPLED TO ATP SYNTHESIS (BY SIMILARITY).
13. COUPLED TO ATP SYNTHESIS (BY SIMILARITY).
14. COPACTOR: TWO HEME GROUPS (BSCS AND BSS6) WHICH ARE NOT COVALENTLY
15. SOUND TO THE PROTEIN (BY SIMILARITY).
16. SIBUNIT: THE MAIN SUBUNITS OF COMPLEX B-C1 ARE: CYTOCHROME B,
17. C. I- SIMILARITY: BELONGS TO THE CYTOCHROME B FAMILY.
18. SIMILARITY: BELONGS TO THE CYTOCHROME B FAMILY.
18. SIMILARITY: BELONGS TO THE CYTOCHROME B FAMILY.

Mol. Biol. Evol. 8:819-834(1991).
-!-FUNCTION: Component of the ubiquinol-cytochrome c reductase complex (Complex III or cytochrome b-cl complex), which is a respiratory chain that generates an electrochemical potential coupled to ATP synthesis (By similarity).
-!-COPACTOR: Binds two heme groups non-covalently. Heme I (or BL or b562) is low-potential and absorbs at about 566 nm, and heme 2 (or BH or b566) is high-potential and absorbs at about 566 nm (By

-!- FUNCTION: Component of the ubiquinol-cytochrome c reductase complex (complex II or cytochrome b-cl complex), which is a respiratory chain that generates an electrochemical potential coupled to ATP synthesis (By similarity).

-!- COFACTOR: Binds two heme groups non-covalently. Heme 1 (or BL b562) is low-potential and absorbs at about 562 nm, and heme 2 BH or b566) is high-potential and absorbs at about 566 nm (By
                                                                                                                                                                                                                                                                                                                                                    similarity).
-!-SUBMUTT: The main subunits of complex b-c1 are: cytochrome b, cytochrome c1 and the Rieske protein (By similarity).
-!-SIMILARITY: Belongs to the cytochrome b family.
-!-SIMILARITY: Belongs to the cytochrome b family.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Phylogenet. Evol. 11:351-360(1999).

FUNCTION: Component of the ubiquinol-cytochrome c reductase complex (complex II or cytochrome b-c1 complex), which is a respiratory chain that generates an electrochemical potential coupled to ATP synthesis (By similarity).
                                                          -!-SIGNUNT: The main subunits of complex b-cl are: cytochrome b, cytochrome cl and the Rieske protein (By similarity).
-!-SIMILARITY: Belongs to the cytochrome b family.

c.i. SUBUNIT: The main subunits of complex b-cl are: cytochrome b, cytochrome cl and the Rieske protein (By similarity).

c.i. SIMILARITY: Belongs to the cytochrome b family.

Phylogenet. Evol. 11:351-360(1999).

-!- FUNCTION: Component of the ubiquinol-cytochrome c reductase complex (complex II or cytochrome b-cl complex), which is a respiratory chain that generates an electrochemical potential coupled to ATP synthesis (By similarity).

-!- COFACTOR: Binds two heme groups non-covalently. Heme I (or BL b562) is low-potential and absorbs at about 562 nm, and heme B. Hy or b566) is high-potential and absorbs at about 566 nm (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         STRAIN=Aquarium strain;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Mamm. Sci. 18:609-621(2002).
FUNCTION: Component of the ubiquinol-cytochrome c reductase complex (complex II or cytochrome b-c1 complex), which is a respiratory chain that generates an electrochemical potential coupled to ATP synthesis (By similarity).
COPACTOR: Binds two heme groups non-covalently. Heme 1 (or BL or B562) is low-potential and absorbs at about 562 nm, and heme 2 (or BH or b566) is high-potential and absorbs at about 566 nm (By

```
C-1-SUBUNIT: The main subunits of complex b-c1 are: cytochrome b, cytochrome c1 and the Rieske protein (By similarity).

C-1-SIMILARITY: Belongs the cytochrome b family.

Ecol. 13:149-166[2004].

-!- FUNCTION: Component of the ubiquinol-cytochrome c reductase complex (complex II or cytochrome b-cl complex), which is a respiratory chain that generates an electrochemical potential coupled to ATP synthesis (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             similarity).
--- SUBUNIT: The main subunits of complex b-cl are: cytochrome b, cytochrome-cl and the Rieske protein (By similarity).
--- SIMILARITY: Belongs to the cytochrome b family.

Copela (10:1019-1028(2000).

-!- FUNCTION: Component of the ubiquinol-cytochrome c reductase complex (complex III or cytochrome b-c1 complex), which is a respiratory chain that generates an electrochemical potential coupled to ATP synthesis (By similarity).

-!- COPACTOR, Binds two heme groups non-covalently. Heme 1 (or BL or b562) is low-potential and absorbs at about 562 nm, and heme 2 (BH or b566) is high-potential and absorbs at about 560 nm (By

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  "Molecular systematics and phylogeography of the Plethodon elongatus species group: combining phylogenetic and population genetic methods species group: combining phylogenetic and population genetic methods to investigate species history.";

MOI. Ecol. 13:149-166(2004).

-!- FUNCTION: Component of the ubiquinol-cytochrome c reductase complex (complex III or cytochrome b-c1 complex), which is a respiratory chain that generates an electrochemical potential coupled to ATP synthesis (By similarity).

-!- COPACTOR: Binds two heme groups non-covalently. Heme 1 (or BL or b562) is low-potential and absorbs at about 562 nm, and heme 2 (or BH or b566) is high-potential and absorbs at about 566 nm (By constitutions).
                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Mitochondrion.

셤 Gastrointestinal epithelial tumour cell; alpha6beta4 integrin; tumour-associated antigen; metastatic disease; malignant disease; tumour typing; tumour screening; tumour.

Synthetic. Macaca fascicularis.

ö The present sequence represents a Monkey antibody light chain linked to a heavy chain. The antibody binds to a target structure displayed in and on the cell surface of human gastrointestinal epithelial tumour cells and in a subpopulation of normal numan gastrointestinal epithelial cells. The target structure especially comprises alphaébeta4 integrin. This is a tumour-associated antigen. The antibody, and its fragments, are useful for treating conditions based on anti-angiogenic mechanism in humans. They are useful for treating human metastatic and malignant disease, for in vitvo diagnosis and prognosis of human malignant disease, comprising tumour typing, tumour screening, tumour diagnosis and prognosis and monitoring premalignant conditions. Quantitative in vivo diagnosis is carried out by determining the localization of antibody to Novel antibody for diagnosis, treatment of human metastatic and malignant diseases, has binding structure for target structure displayed on cell surface of human gastrointestinal epithelial tumor and normal cells. The present invention relates to a phage display library of variable heavy domain (VHH or VH) fragments (sdAb fragments) derived from llama antibodies. The library is useful for in vitro selection against any antigen of interest as a target. Single domain anti-idiotypic antibody fragments are isolated from the library using phage display technology and an antibody serving as an antigen. Such anti-idiotypic antibody cragments have great potential in evoking the immune system response to pathological antigens and in vaccine development. The large size of the library considerably increases the probability of isolating from it predetermined target (antigen of interest). The library eliminates the development of anti-idiotypic antibodies by immunisation and allows isolation of anti-idiotypic antibodies. AAU82435-AAU82635 represent the lama heavy chain domain fragments of the invention. (Updated on 29-AUG-2003 to standardise OS field)
                                                                                                                                                                        New phage display library of variable heavy domain antigen-binding fragments derived from llama antibodies, useful for in vitro selection against any antigen of interest as a target.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Score 65; DB 5;

The present invention describes an antibody molecule (I) capable of specifically recognising two regions of the beta-A4 peptide/Abeta4. The first region comprises the amino acid sequence Ala-Glu-Pha-Ang-His-Ang-Glu-Pha-Ang-His-Ang-Glu-Pha-Ang-His-Ang-His-Ang-Glu-Pha-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang-His-Ang
                                                                                                                                                                            New antibody molecule capable of specifically recognizing two regions of
the beta-A4 peptide, useful for diagnosing, preventing or treating
diseases associated with amyloidogenesis or amyloid-plaque formation

The present invention describes an antibody molecule (1) capable of specifically recognising two regions of the beta-A4 peptide/Abeta4. The first region comprises the amino acid sequence Ala-Glu-Phe-Aag-His-Asp-Car-Gly-Tyr ADA89886 or its fragment, and the second region comprises the amino acid sequence Val-His-His-Gln-Lys-Leu-Val-Phe-Phe-Ala-Glu-Asp-Val-Gly ADA88987 or its fragment. Also described: (1) a muclaic acid molecule cencoding (1); (2) a vector comprising the nucleic acid of (1); (3) a host cell comprising the vector of (2); (4) preparing (1), comprising the bost cell of (3) under conditions that allow synthesis of culturing the host cell of (3) under conditions that allow synthesis of culturing the host cell of (3) under conditions that allow synthesis of culturing the host cell of (3) under conditions that allow synthesis of culturing the host cell of (3) under conditions that allow synthesis of (1) and recovering (1) from the culture; (5) a composition comprising (1), vector of (2) or host cell of (3); (7) optimising (1), or nucleic acid of (1), vector of (2) or host cell of (3); (7) optimising (1) cultured (2) a kit comprising optimisation of (1), and formulating the captimised clones; (1) preparing a pharmaceutical composition prepared by method (8): (1) has characeutical composition prepared by method (8): (1) has characeutical composition prepared by method (8): (1) has characeutical composition of the antibody molecule of a disease associated with amyloid-plaque formation. The antibody molecule of the prevention and/or treatment of a disease associated with amyloid-plaque formation. The antibody molecule of the disease mentioned above. The antibody is used for the disease mentioned above. The antibody is used for the described antibody also beta-amyloid plaque formation. In particular, the disease is capainst beta-amyloid plaque formation. In particular, the disease is capainst beta-amyloid plaque formation of the disease, wherefitary cerebral hemotral composition.

Composition of sequence is 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

The present invention describes an antibody molecule (I) capable of specifically recognising two regions of the beta-A4 peptide/Abeta4. The first region comprises the amino acid sequence Ala-Glu-Phe-Arg-His-App-Ser-Gly-Tyr ADAB9886 or its fragment, and the second region comprises the amino acid sequence Val-His-His-Gln-Lyg-Leu-Val-Phe-Aha-Glu-Abp-Val-Gly ADAB9887 or its fragment. Also described: (I) a nucleic acid molecule cording (I); (2) a vector comprising the nucleic acid of (I); (3) a host coll comprising the vector of (2); (4) preparing (I), comprising (I) coll comprising the vector of (2); (4) preparing (I), comprising (I) contributed molecule produced by method (4); (6) a kit comprising (I) or an antibody molecule produced by method (4); (6) a kit comprising (I) cor an antibody molecule produced by method (4); (6) a kit comprising (I) cor an antibody molecule produced by method (4); (6) a kit comprising (I) cordinated of (I), vector of (2) or host cell of (3); (7) optimising (I) cordinated of (I); and recovering (II) preparing a pharmaceutical composition, comprising optimisation of (I), and formulating the coptimised antibody/antibody molecule with a carrier; and (12) a composition, compresition, prepared by method (8). (I) has composition, prepared by method (8). (I) has composition prepared by method (8). (I) has controprotective, nootropic and antiparkinsonian activities, and can be used in preparing a disease associated with any also be used in preparing a disease associated with action of beter amyloid plaque formation. The antibody administration of dementia, Alzheimer's d
                                                                                                                                                                                                                                                         nootropic, antiparkinsonian; gene therapy; amyloidogenesis; amyloid-plaque formation; beta-amyloid plaque; immunisation; dementia; Alzheimer: disease; mctor neuropathy; Down's syndrome; Creutzfeldt Jacob disease; heraditary cerebral haemorrhage; amyloidosis; Parkinson's disease; HIV-related dementia; amylotrophic lateral sclerosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New antibody molecule capable of specifically recognizing two regions of
the beta-A4 peptide, useful for diagnosing, preventing or treating
diseases associated with amyloidogenesis or amyloid-plaque formation

The first region comprises the amino acid sequence Ala-Glu-Phe-Arg-His-Asp-Ser-Gly-Tyr ADA89886 or its fragment, and the second region comprises the amino acid sequence Val-His-His-Gln-Lys-Leu-Val-Phe-Phe-Ala-Glu-Asp-Val-Gly ADA89887 or its fragment. Also described: (I) a nucleic acid molecule encoding (I); (2) a vector comprising the nucleic acid of (1); (3) a host cell comprising the vector of (2); (4) preparing (I), comprising the host cell of (3) under conditions that allow synthesis of (I) and recovering (I) from the culture; (5) a composition comprising (I) and recovering (I) from the culture; (5) a composition comprising (I), nucleic acid of (I), vector of (2) or host cell of (3); (7) optimisation (I); (8) testing the resulting Fab optimisation library by panning against Abeta/Abeta4; (9) identifying optimised clones; (10) expressing
                  amyotrophic lateral sclerosis or neuronal disorders related to aging. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           nootropic; antiparkinsonian; gene therapy; amyloidogenesis; amyloid-plaque formation; beta-amyloid plaque; immunisation; dementia; Alzheimer's disease; motor neuropathy; Down's syndrome; Creutzfeldt Jacob disease; hereditary cerebral haemorrhage; amyloidosis; Parkinson's disease; HIV-related dementia; amyotrophic lateral sclerosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New antibody molecule capable of specifically recognizing two regions of
the beta-A4 peptide, useful for diagnosing, preventing or treating
diseases associated with amyloidogenesis or amyloid-plaque formation

Synthetic

The present invention describes an antibody molecule (I) capable of specifically recognising two regions of the beta-A4 peptide/Abeta4. The first region comprises the amino acid sequence Ala-Glu-Phe-Arg-His-Asp-Gre-Gly-Tyx ADA89886 or list fragment, and the second region comprises the amino acid sequence Val-His-His-Gln-Lya-Lpu-Phe-Phe-Ala-Glu-Asp-Val-Gly ADA89887 or list fragment. Also described: (1) a nucleic acid molecule cancoding (I); (2) a vector comprising the nucleic acid of (1); (3) a host cell comprising the vector of (2); (4) preparing (I), comprising of (1); (1) and recovering (I) from the culture; (5) a composition comprising (I), or an antibody molecule produced by method (4); (6) a kit comprising (I), or an antibody molecule produced by method (4); (6) a kit comprising (I), or an antibody molecule produced by method (4); (6) a kit comprising (I), or an antibody molecule produced by method (4); (6) a kit comprising (I), or comprising (I), vector of (2) or host cell of (3); (7) optimising (I), or comprising optimisation library by panning of selected, optimised clones; (10) expressing of selected, optimised clones; (11) preparing a pharmaceutical composition prepared by method (8). (1) has composition, comprising optimisation of (1), and formulating the optimised antibody/antibody molecule with a carrier; and (12) a paramaceutical composition prepared by method (8). (1) has neutroprotective, noctropic and antiparkinsonian activities, and can be used in green therapy. The antibody molecule (I), nucleic acid molecule of the prevention and/or treatment of a disease associated with amy also be used in preparing a diagnostic composition for the detection of the disease mentioned above. The antibody is used for the antibody alsease, hareditary cerebral hammorrhage with anyloidosis butch type, Parkinson's disease, with anyloidosis butch type, Parkinson's disease, with resent sequence is used in the exemplification of the prevention. ö antibody molecule; antibody; beta-A4 peptide; Abeta4; neuroprotective; nootropic; antiparkinsonian; gene therapy; amyloidogenesis; amyloid-plaque formation; beta-amyloid plaque; immunisation; dementia; Alzheimer: disease; motor neuropathy; Down's syndrome; Creutzfeldt Jacob disease; hereditary cerebral haemorrhage; amyloidosis; Parkinson's disease; HIV-related dementia; amyotrophic lateral sclerosis; Gaps ö 74.1%; Score 63; DB 6; Length 17; 76.5%; Pred. The present invention describes an antibody molecule (I) capable of specifically recognising two regions of the beta-A4 peptide/Abeta4. The first region comprises the amino acid sequence Ala-Glu-Phe-Arg-His-Agp-Sar-Gly-Tyr ADA89886 or its fragment, and the second region comprises the amino acid sequence Val-His-His-Glu-Lys-Leu-Val-Phe-Phe-Arg-His-Agp-CG Gly ADA89886 or its fragment, and the second region comprises the amino acid sequence Val-His-His-Glu-Lys-Leu-Val-Phe-Phe-Ala-Glu-Asp-Val-CG Gly ADA898897 or its fragment. Also described: (1) a mucleic acid molecule encoding (I); (2) a vector comprising the nucleic acid of (1); (3) a host coll comprising the vector of (2); (4) preparing (1), comprising (I) contains the bost cell of (3) under conditions that allow synthesis of (I) and recovering (I) from the culture; (5) a composition comprising (I) or an antibody molecule produced by method (4); (6) a kit comprising (I) or an antibody molecule produced by method (4); (6) a kit comprising (I) or an antibody antipody molecule proprimised clones; (10) expressing (1); (8) testing the resulting Pab optimisation library by panning against Abeta(Abeta(4); (9) identifying optimised clones; (10) expressing of selected, optimised clones; (11) preparing a pharmaceutical composition prepared by method (8). (I) has composition prepared by method (8). (I) has composition prepared by method (8). (I) has certor or host is useful in preparing a pharmaceutical composition for the prevention and/or amyloid-plaque formation. The antibody molecule may also be used in preparing a disease associated with entition of the disease mentioned above The antibody is used for the detection of the disease mentioned above The antibody is used for the detection of the disease mentioned above The antibody is used for the detection of the disease mentioned above The antibody is used for the detection of the disease mentioned above The antibody is used for the detection of the disease mentioned above The antibody is used to the disease mentioned ab
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 amyloidosis Dutch type, Parkinson's disease, HIV-related dementia, amyotrophic lateral sclerosis or neuronal disorders related to aging. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                 New antibody molecule capable of specifically recognizing two regions of
the beta-A4 peptide, useful for diagnosing, preventing or treating
diseases associated with amyloidogenesis or amyloid-plaque formation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          disintegration of beta-amyloid plaques or for passive immunisation against beta-amyloid plaque formation. In particular, the disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            dementia, Alzheimer's disease, motor neuropathy, Down's syndrome,

Anti-Abeta antibody related amino acid sequence SEQ ID NO:305.

음.

```
The present invention describes an antibody molecule (I) capable of specifically recognising two regions of the beta-A4 peptide/Abeta4. The first region comprises the amino acid sequence Ala-Glu-Phe-Arg-His-App. (C Ser-Gly-Tyr ADA89866 or its fragment, and the second region comprises the amino acid sequence val-His-His-Gln-Lys-Leu-Val-Phe-Phe-Ala-Glu-Asp-Val-Cly ADA89887 or its fragment, and the second region comprises the canoding (I); (2) a vector comprising the nucleic acid of (1); (3) a host concoding (I); (2) a vector comprising the nucleic acid of (1); (3) a host cell comprising the vector of (2); (4) preparing (I), comprising (I) or an antibody molecule produced by method (4); (6) a kit comprising (I) or an antibody molecule produced by method (4); (6) a kit comprising (I) or an antibody molecule produced by method (4); (6) a kit comprising (I) or an antibody molecule produced by method (4); (6) a kit comprising (I) or nucleic acid of (1), vector of (2) or host cell of (3); (7) optimising (I) or nucleic acid of (1), vector of (2) or host cell of (3); (10) expressing (1); (8) testing the resulting Fab optimised clones; (10) expressing of selected, optimisation of (I), and formulating the optimised antibody antibody molecule with a carrier; and (12) a pharmaceutical composition prepared by method (8). (I) has compressing optimisation of (I), and formulating the composition and/or the antibody molecule with a carrier; and common for the prevention and/or reatment of a disease associated with a carrier; and can be used in preparing a disease associated with a carrier; and can be cused in preparing a disease associated with a carrier of candion of the disease mentioned above. The antibody is used for the disease mentioned above. The antibody is used for the disease mentioned bove: The antibody is used for the disease mentioned bove: more of the disease mentioned bove: more of passive immunisation. The disease is more demential companion of perparing a disease is more demential solutions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Creutzfeldt Jacob disease, hereditary cerebral haemorrhage with amyloidosis Dutch type, Parkinson's disease, HTV-related dementia, amyloidosis Dutch type, Parkinson's disease, HTV-related dementia, amyotrophic lateral sclerosis or neuronal disorders related to aging. The present sequence is used in the exemplification of the present invention.
Alzheimer's disease; motor neuropathy; Down's syndrome;
Creutzfeldt Jacob disease; hereditary cerebral haemorrhage; amyloidosis;
Parkinson's disease; HIV-related dementia; amyotrophic lateral sclerosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New antibody molecule capable of specifically recognizing two regions of
the beta-A4 peptide, useful for diagnosing, preventing or treating
diseases associated with amyloidogenesis or amyloid-plaque formation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                          Kretzschmar T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              .

The present invention describes an antibody molecule (I) capable of specifically recognising two regions of the beta-A4 peptide/Abeta4. The first region comprises the amino acid sequence Ala-Glu-Phe-Arg-His-Asp. Ser-Gly-Tyr ADAB9886 or its fragment, and the second region comprises the amino acid sequence val-His-His-Glu-Lys-Leu-Val-Phe-Phe-Ala-Glu-Asp-Val-Gly ADA89887 or its fragment. Also described: (I) a nucleic acid molecule encoding (I); (2) a vector comprising the nucleic acid of (I); (3) a host culturing the host cell of (3); (4) preparing (I), comprising culturing the host cell of (3) under conditions that allow synthesis of (I) and recovering (I) from the culture; (5) a composition comprising (I), nucleic acid of (I), vector of (2) or host cell of (3); (7) optimising (I); (8) testing the resulting Fab optimisation library by panning against Abeta4/Abeta4; (9) identifying optimised clones; (10) expressing of selected, optimised clones; (11) reparing the composition, comprising optimisation of (I), and formulating the composition, comprising optimisation of (I), and (12) a composition of (2) or host cell (2) and (2) an
                                                                                                                                                                                                                                                               antibody molecule, antibody; beta-A4 peptide; Abeta4; neuroprotective; nootropic; antiparkinsonian; gene therapy; amyloidogenesis; amyloid-plaque formation; beta-amyloid plaque; immuniaation; dementia; Alzheimer's disease; motor neuropathy; Down's syndrome; Creutzfeldt Jacob disease; hereditary cerebral haemorrhage; amyloidosis; Parkinson's disease; HIV-related dementia; amyotrophic lateral sclerosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 pharmaceutical composition prepared by method (8). (1) has neuroprotective, nootropic and antiparkinsonian activities, and can be used in gene therapy. The antibody molecule (1), nucleic acid molecule, vector or host is useful in preparing a pharmaceutical composition for the prevention and/or treatment of a disease associated with amyloidogenesis and/or amyloid-plaque formation. The antibody molecule may also be used in preparing a diagnostic composition for the detection of the disease mentioned above. The antibody is used for the disintegration of beta-amyloid plaques or for passive immunisation against beta-amyloid plaques or for passive immunisation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New antibody molecule capable of specifically recognizing two regions of
the beta-A4 peptide, useful for diagnosing, preventing or treating
diseases associated with amyloidogenesis or amyloid-plaque formation
                                                                                                                                                                                                              Anti-Abeta antibody related amino acid sequence SEQ ID NO:303
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Example 16; Page 271-272; 312pp; English.

The present invention describes an antibody molecule (I) capable of specifically recognising two regions of the beta-A4 peptide/Abeta4. The first region comprises the amino acid sequence Ala-Glu-Phe-Arg-His-Asp-Ser-Gly-Tyr ADA89886 or its fragment, and the second region comprises the amino acid sequence Val-His-His-Gln-Lys-Leu-Val-Phe-Phe-Ala-Glu-Asp-Val-Gly ADA89887 or its fragment. Also described: (1) a nucleic acid molecule encoding (I); (2) a vector comprising the nucleic acid of (1); (3) a host cell comprising the vector of (2); (4) preparing (I), comprising culturing the host cell of (3) under conditions that allow synthesis of (1) and recovering (I) from the culture; (5) a composition comprising (I) and recovering (I) from the culture; (5) a composition comprising (I) nor an antibody molecule produced by method (4); (6) a kit comprising (I), nucleic acid of (1), vector of (2) or host cell of (3); (7) optimising
                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        antibody molecule, antibody, beta-A4 peptide, Abeta4; neuroprotective, nootropic; antiparkinsonian; gene therapy; amyloidogenesis; amyloid-plaque formation; beta-amyloid plaque; immunisation; dementia; Alzheimer: disease; motor neuropathy; Down's syndrome; Creutzfeldt Jacob disease; hereditary cerebral haemorrhage; amyloidosis; Parkinson's disease; HIV-related dementia; amyotrophic lateral sclerosis;
             Creutzfeldt Jacob disease, hereditary cerebral haemorrhage with, amyloidosis Dutch type. Parkinson's disease, HIV-related dementa, amyloirophic lateral sclerosis or neuronal disorders related to aging. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New antibody molecule capable of specifically recognizing two regions of
the beta-A4 peptide, useful for diagnosing, preventing or treating
diseases associated with amyloidogenesis or amyloid-plaque formation
                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Huber W, Kretzschmar T;

composition, comprising the resulting rand polarization initiary by painting district Abeta/Abeta4; (9) identifying optimised clones; (11) preparing a pharmaceutical composition, comprising optimisation of (1), and formulating the optimised antibody/antibody molecule with a carrier; and (12) a composition prepared by method (8). (1) has contropic and antiparkinsonian activities, and can be used in gene therapy. The antibody molecule with a carrier acid molecule, vector or host is useful in preparing a pharmaceutical composition for the prevention and/or treatment of a disease associated with amyloidogenesis and/or amyloid-plaque formation. The antibody molecule may also be used in preparing a disease associated with anyloid-plaque formation. The antibody molecule anyloidogenesis and/or amyloid-plaque formation. The antibody molecule anyloidogenesis or for passive immunisation of the disease mentioned above. The antibody is used for the disease mentioned above. The antibody is used for the disease is dementia, Alzheimer's disease, motor neuropathy, Down's syndrome, creutzfeldt Jacob disease, motor neuropathy, Down's syndrome, amyloidosis Dutch type, Parkinson's disease, HIV-related dementia, amyotrophic lateral sclerosis or neuropal disorders related to aging. The present sequence is used in the exemplification of the present invention.

New antibody molecule capable of specifically recognizing two regions of the beta-A4 peptide, useful for diagnosing, preventing or treating diseases associated with amyloidogenesis or amyloid-plaque formation (e.g. dementia) THE LICENSE BY SEX BY S

The present invention describes an antibody molecule (1) capable of specifically recognising two regions of the beta-A4 peptide/Abeta4. The first region comprises the amino acid sequence Ala-Glu-Phe-Arg-His-Asp-Sar-Gly-Tyr ADA89886 or its fragment, and the second region comprises the amino acid sequence Val-His-His-Gln-Lys-Leu-Val-Phe-Phe-Ala-Glu-Asp-Val-Gly ADA89887 or its fragment, Also described: (1) a nucleic acid molecule encoding (1); (2) a vector comprising the nucleic acid of (1); (3) a host cell comprising the vector of (2); (4) preparing (1); comprising the host cell of (3) under conditions that allow synthesis of (1) and recovering (1) from the culture; (5) a composition comprising (1) cucleic acid of (1), vector of (2) or host cell of (3); (7) optimising (1); (8) testing the resulting Rab optimised clones; (10) expressing (1); (8) testing the resulting Rab optimised clones; (10) expressing of selected, optimised clones; (11) preparage of selected, optimised clones; (11) reader of (12); and formulating the composition, comprising optimised approach (12) a composition of (12) and composition of (13); and (12) and (12) and (12) and (13); a phramaceutical composition prepared by method (8). (I) has neuroprotective, nootropic and antiparkinsonian activities, and can be neuroprotective, nootropic and antiparkinsonian activities, and can be newed in gene therapy. The antibody molecule (1), nucleic acid molecule, vector or host is useful in preparing a pharmaceutical composition for the prevention and/or treatment of a disease associated with anyloid pensating a disease associated with anyloid-plaque formation. The antibody molecule may also be used in preparing a disgnostic composition for the detection of the disease mentioned above. The antibody is used for the disease mentioned above. The antibody is used for the disease mention of beta-amyloid plaques or for passive immunisation against beta-amyloid plaque formation. In particular, the disease is dementa, Alzheimer's disease, motor neuropathy, Down's syndrome, amyloid plaque formation, derebral haemorrhage with amyloid disease, hereditary cerebral haemorrhage with amyloidosis Dutch type, Parkinson's disease, HIV-related dementia, amyloidosis Dutch type, Parkinson's disease, HIV-related dementia, amyloidosis butch type, Parkinson's disease, HIV-related dementia, camyotrophic lateral sclerosis or neuronal disorders related to aging. The present sequence is used in the exemplification of the present invention. Example 13; Page 92; 312pp; English.

```
The present invention describes an antibody molecule (I) capable of specifically recognising two regions of the beta-A4 peptide/Abeta4. The first region comprises the amino acid sequence Ala-Glu-Phe-Arg-His-Asp-Ser-Gly-Tyr ADA89886 or its fragment, and the second region comprises the amino acid sequence Val-His-His-Glu-Val-Phe-Phe-Ala-Glu-Asp-Val-Cly-Tyr ADA89887 or its fragment, Also described: (I) a mucleic acid molecule coding (I); (2) a vector comprising the nucleic acid of (I); (3) a host call comprising the vector of (2); (4) preparing (I), comprising the vector of (2); (4) preparing (I), comprising (I) culturing the host cell of (3) under conditions that allow synthesis of (I) and recovering (I) from the culture; (5) a composition comprising (I) or an antibody molecule produced by method (4); (6) a kit comprising (I), nucleic acid of (I), vector of (2) or host cell of (3); (7) optimising (I), adainst AbetaAAbeta4; (9) identifying optimised clones; (II) esparing a pharmaceutical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     amyloidosis Dutch type, Parkinson's disease, HIV-related dementia, amyotrophic lateral sclerosis or neuronal disorders related to aging. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                New antibody molecule capable of specifically recognizing two regions of
the beta-A4 peptide, useful for diagnosing, preventing or treating
diseases associated with amyloidogenesis or amyloid-plaque formation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         amyloidogenesis and/or amyloid-plaque formation. The antibody molecule may also be used in preparing a diagnostic composition for the detection of the disease mentioned above. The antibody is used for the disintegration of beta-amyloid plaques or for passive immunisation against beta-amyloid plaques or for passive immunisation against beta-amyloid plaque formation. In particular, the disease is dementia, Alzheimer's disease, motor neuropathy, Down's syndrome, Creuzzfeldt Jacob disease, hereditary cerebral haemorrhage with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        pharmaceutical composition prepared by method (8). New antibody molecule capable of specifically recognizing two regions of the beta-A4 peptide, useful for diagnosing, preventing or treating diseases associated with amyloidogenesis or amyloid-plaque formation (e.g. dementia).

Disclosure; Page 188; 312pp; English

The present invention describes an antibody molecule (I) capable of appecifically recognising two regions of the beta-A4 peptide/Abbeta4. The first region comprises the amino acid sequence Ala-Glu-Phe-Arg-His-Appering the amino acid sequence Ala-Glu-Phe-Arg-His-Appering the Appendix of Ser-Gly-Tyx ADA8986 or its fragment, and the second region comprises the amino acid sequence Val-His-His-Glu-Lys-Leu-Val-Phe-Phe-Ala-Glu-App-Val-Cdly ADA89887 or its fragment. Also described: (I) a nucleic acid molecule conding (I); (2) a vector comprising the nucleic acid of (I); (3) a host cell comprising the vector of (2); (4) preparing (I), comprising (I) collarising the host cell of (3) index conditions that allow synthesis of culturing the host cell of (3) index conditions that allow synthesis of culturing the host cell of (3) index conditions that allow synthesis of culturing the resulting Pab optimisation of (3); (7) optimising (I) or nucleic acid of (I), vector of (2) or host cell of (3); (7) optimising (I) comprision (1) and formation of (1); and formulating the cell against AbetaA/Abeta4; (9) identifying optimisation of (1); and formulating the coptimisation of (I); and formulating the coptimisation of (I), and formulating the coptimisation of (I); and formulating a pharmaceutical composition for the disease mentioned and/or treatment of a disease as of disease is dementia, Alzheimer's disease, motor neuropathy, bown's syndrome, coffice the prevention and/or treatment of adeservation of the parawine of the disease, hereditary cerebral dementia, Alzheimer's disease, motor neuropathy, related dementia, any di

σţ New antibody molecule capable of specifically recognizing two regions the beta-A4 peptide, useful for diagnosing, preventing or treating diseases associated with amyloidogenesis or amyloid-plaque formation (e.g. dementia)

Example 13; Page 92; 312pp; English.

The present invention describes an antibody molecule (I) capable of grecifically recognising two regions of the beta-A4 peptide/Abeta4. The first region comprises the amino acid sequence Ala-Glu-Phe-Arg-His-Asp-Ser-Gly-Tyr ADA89886 or its fragment, and the second region comprises the amino acid sequence val-His-His-Glu-Lys-Leu-Val-Phe-Phe-Ala-Glu-Asp-Val-Gly ADA89887 or its fragment. Also described: (I) a nucleic acid molecule encoding (I); (2) a vector comprising the nucleic acid of (I); (3) a host cell comprising the vector of (2); (4) preparing (I), comprising of culturing the host cell of (3) under conditions that allow synthesis of (I) and recovering (I) from the culture; (5) a composition comprising (I), nucleic acid of (I), vector of (2) or host cell of (3); (4) optimising (I), (8) testing the resulting Fab optimisation library by panning (I); (8) testing the resulting Fab optimised clones; (10) expressing of selected, optimised clones; (11) reparing a pharmaceutical composition, comprising optimisation of (I), and formulating the composition of (1), and carrier; and (12) a patimised antibody/Amistibody molecule with a carrier; and (12) a pharmaceutical composition prepared by method (8). (1) has neuroprotective, nootropic and antiparkinsonian activities, and can be used in gene therapy. The antibody molecule (1), nucleic acid molecule, vector or host is useful in preparing a pharmaceutical composition for the prevention and/or treatment of a disease associated with amyloidogenesis and/or amyloid-plaque formation. The antibody molecule may also be used in preparing a diagnostic composition for the disease mentioned above. The antibody is used for the detection of the disease mentioned above. The antibody is used for the

ö disintegration of beta-amyloid plaques or for passive immunisation against beta-amyloid plaque formation. In particular, the disease is dementia, Alzheimer's disease, motor neuropathy, Down's syndrome, Creutzfeldt Jacob disease, hereditary cerebral haemorrhage with amyloidosis Ducch type, Parkinson's disease, HIV-related dementia, amyloicophic lateral sclerosis or neuronal disorders related to aging. The present sequence is used in the exemplification of the present invention. nootropic; antiparkinsonian; gene therapy; amyloidogenesis; amyloid-plaque formation; beta-amyloid plaque; immunisation; dementia; amyloid-plaque formation; beta-amyloid plaque; immunisation; dementia; althemismer; disease; motor neuropathy; Down's syndrome; Creutzfeldt Jacob disease; hereditary cerebral haemorrhage; amyloidosis; Parkinson's disease; HIV-related dementia; amyotrophic lateral sclerosis; antibody molecule; antibody; beta-A4 peptide; Abeta4; neuroprotective; Gaps ö Length 17; Score 62; DB 6; Length 17; Pred. The present invention describes an antibody molecule (I) capable of specifically recognising two regions of the beta-A4 peptide/Abeta4. The first region comprises the amino acid sequence Ala-Glu-Phe-Arg-His-Asp-Ser-Gly-Tyr ADA89886 or its fragment, and the second region comprises the amino acid sequence Val-His-Gln-Lys-Leu-Val-Phe-Phe-Ala-Glu-Asp-Val-Gly ADA89887 or its fragment. Also described: (I) a nucleic acid molecule encoding (I); (2) a vector comprising the nucleic acid of (I); (3) a host cell comprising the vector of (2); (4) preparing (I), comprising culturing the host cell of (3) under conditions that allow synthesis of (I) and recovering (I) from the culture; (5) a composition comprising (I)

optumizers anti-body microture with a callier and (12) a plarmaceutical composition prepared by method (8). (1) has neuroprotective, nootropic and antiparkinsonian activities, and can be used in gene therapy. The antibody molecule (1), nucleic acid molecule, vector or host is useful in preparing a pharmaceutical composition for the prevention and/or amyloid-plaque formation. The antibody molecule amyloid-openesis and/or amyloid-plaque formation. The antibody molecule of the disease mentioned above. The antibody is used for the detection of the disease mentioned above. The antibody is used for the detection of the disease mayloid plaques or for passive immunisation. Compaints beta-amyloid plaque formation. In particular, the disease is dementia, Alzheimer's disease, motor neuropathy. Down's syndrome, creuzfeldt Jacob disease, hereditary cerebral haemorthage with amyloidosis Dutch trype, Parkinson's disease, HIV-related dementia, amyloidosis Dutch trype, Parkinson's disease. HIV-related dementia, amyloidosis dutch trype, Parkinson's disease, related to aging. The present sequence is used in the exemplification of the present invention. comprising (I) or an antibody molecule produced by method (4); (6) a kit comprising (1) nucleic acid of (1), vector of (2) or host cell of (3); (7) optimising (1); (8) testing the resulting Fab optimisation library by panning against Abeta/Abeta4, (9) identifying optimised clones; (10) expressing of selected, optimised clones; (11) preparing a pharmaceutical composition, comprising optimisation of (1), and formulating the optimised antibody/antibody molecule with a carrier; and (12) a 0

New antibody molecule capable of specifically recognizing two regions of the beta-A4 peptide, useful for diagnosing, preventing or treating

The present invention describes an antibody molecule (I) capable of specifically recognising two regions of the beta-A4 peptide/Abeta4. The first region comprises the amino acid sequence Ala-Galu-Phe-Arg-His-Asp-Ser-Gay-Tyr ADA8986 or its fragment, and the second region comprises the amino acid sequence val-His-His-Gln-Lys-Leu-Val-Phe-Phe-Ala-Glu-App-Val-Gly ADA89887 or its fragment. Also described: (1) a nucleic acid molecule cancoding (I); (2) a vector comprising the nucleic acid of (1); (3) a host call comprising the vector of (2); (4) preparing (I), comprising the host cell of (3) under conditions that allow synthesis of call comprising the host cell of (3) under conditions that allow synthesis of call comprising the recentling Pab optimisation in the comprising (I), and recovering (I) from the culture; (5) a composition comprising (I), comprising the resulting Fab optimisation library by panning or selected, optimised clones; (1) preparing a pharmaceutical composition for (I), and formulating the optimised clones; (1) preparing a pharmaceutical composition prepared by method (8). (1) has composition for optimised antibody molecule with a carrier; and (12). a pharmaceutical composition prepared by method (8). (1) has composition for used in gene therapy. The antibody molecule (I), nucleic acid molecule. Weeter or host is useful in preparing a pharmaceutical composition for the prevention and/or treatment of a disease associated with amyloid-plaque formation. The antibody molecule of the disease mentioned above. The antibody is used for the disease mentioned above. The antibody is used for the disease mentioned above. The antibody is used for the disease is capmined above. The antibody is used for the disease mentioned above. The antibody is used for the disease mention of beta-amyloid plaques or for passive immunisation. Companied the disease, hereditary cerebral hemorrhage with amyloid-sieses, hereditary cerebral hemorrhage with amyloid-sieses, hereditary cerebral hemorrhage or the prevention of beta-amylo ö Gaps diseases associated with amyloidogenesis or amyloid-plaque formation . 72.9%; Score 62; DB 6; Length 17; 76.5%; Pred. Bardroff M, Loehning C, The present invention describes an antibody molecule (I) capable of specifically recognising two regions of the beta-A4 peptide/Abeta4. The first region comprises the amino acid sequence Ala-Glu-Phe-Argg-His-Agp. Ser-Gly-Tyr ADA89886 or its fragment, and the second region comprises the amino acid sequence Val-His-His-Gln-Lys-Leu-Val-Phe-Phe-Ala-Glu-Asp-Val-Gly ADA89887 or its fragment. Also described: (I) a mucleic acid molecule encoding (I); (2) a vector comprising the nucleic acid of (1); (3) a host cell comprising the vector of (2); (4) preparing (I), comprising (I) comprising the vector of (2); (4) preparing (I), comprising (I) comprising the host cell of (3) under conditions that allow synthesis of (I) and recovering (I) from the culture; (5) a composition comprising (I) or an antibody molecule produced by method (4); (6) a kit comprising (I) or an antibody molecule produced by method (4); (6) a kit comprising (I) or an antibody molecule produced by method (4); (6) a kit comprising (I) or an antibody antibody molecule (I), and formulating the composition, comprising pab optimised clones; (10) expressing deslected, optimised clones; (II) preparing a pharmaceutical composition prepared by method (8). (I) has neuroprotective, nootropic and antiparkinsonian activities, and can be neuroprotective, nootropic and antiparkinsonian activities, and can be used in ore herapy. The antibody molecule (I), nucleic acid molecule, and any least associated with Creutzfeldt Jacob disease, hereditary cerebral haemorrhage with amyloidosis Dutch type, Parkinson's disease, HIV-related dementia, amyotrophic lateral sclerosis or neuronal disorders related to aging. The present sequence is used in the exemplification of the present invention. ŏ may also be used in preparing a diagnostic composition for the detection of the disease mentioned above. The antibody is used for the disintegration of beta-amyloid plaques or for passive immunisation against beta-amyloid plaque formation. In particular, the disease is New antibody molecule capable of specifically recognizing two regions the beta-A4 peptide, useful for diagnosing, preventing or treating diseases associated with amyloidogenesis or amyloid-plaque formation dementia, Alzheimer's disease, motor neuropathy, Down's syndrome, Kretzschmar T; Huber W, Rothe C; Brockhaus M, Nordstedt C, Example 5; Page 64; 312pp; English. The present invention describes an antibody molecule (I) capable of gpecifically recognising two regions of the beta-A4 peptide/Abeta4. The first region comprises the amino acid sequence Ala-Glu-Phe-Arg-His-Asp-Ser-Gly-Tyr ADA89886 or its fragment, and the second region comprises the amino acid sequence Val-His-His-Gln-Lys-Leu-Val-Phe-Phe-Ala-Glu-Asp-Val-Gly ADA89887 or its fragment. Also described: (I) a nucleic acid molecule encoding (I); (2) a vector comprising the nucleic acid of (I); (3) a host call comprising the vector of (2); (4) preparing (I), comprising of culturing the host cell of (3); (4) preparing (I), comprising (I) and recovering (I) from the culture; (5) a composition comprising (I) culture; (6) a kit comprising (I) and recovering (I) from the culture; (5) a composition comprising (I); (8) testing the resulting Fab optimisation library by panning against Abeta4, (9) identifying optimised clones; (10) expressing composition, comprising optimisation of (I), and formulating the composition, comprising optimisation of (I), and formulating the composition of (I), and carrier; and (12) a composition composition of (I), and carrier; and (12) a pharmaceutical composition prepared by method (8). (I) has neuroprotective, nootropic and antiparkinsonian activities, and can be used in gene therapy. The antibody molecule (I), nucleic acid molecule, vector or host is useful in preparing a pharmaceutical composition for the prevention and/or treatment of a disease associated with amyloidogenesis and/or amyloid-plaque formation. The antibody molecule

The first region comprises the amino acid sequence Ala-Glu-Phe-Arg-His-Asp-Ser-Gly-Tyr ADA89886 or its fragment, and the second region comprises the amino acid sequence Val-His-His-Gln-Lys-Leu-Val-Phe-Phe-Ala-Glu-Asp-Val-Gly ADA89887 or its fragment. Also described: (1) a nucleic acid molecule encoding (1); (2) a vector comprising the nucleic acid of (1); (3) a host cell comprising the vector of (2); (4) preparing (1), comprising
may also be used in preparing a diagnostic composition for the detection of the disease mentioned above. The antibody is used for the disintegration of beta-amyloid plaques or for passive immunisation against beta-amyloid plaque formation. In particular, the disease is dementia, Alzheimer's disease, motor neuropathy, Down's syndrome, creutzfeldt Jacob disease, hereditary cerebral haemorrhage with amyloidosis Dutch type, Parkinson's disease, HIV-related dementia, amyotrophic lateral sclerosis or neuronal disorders related to aging. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 nootropic; antiparkinsonian; gene therapy; amyloidogenesis;

The present invention describes an antibody molecule (I) capable of first present invention describes an antibody molecule (I) capable of first region comprises the amino acid sequence Ala-Glu-Phe-Ala-Glu-Abap-Ser-Gly-Tyr AbA89886 or its fragment, and the second region comprises the amino acid sequence Val-His-His-Gln-Lys-Leu-Val-Phe-Phe-Ala-Glu-App-Val-CG Jy AbA89887 or its fragment. Also described: (I) a nucleic acid molecule encoding (I); (2) a vector comprising the nucleic acid molecule conding (I); (2) a vector comprising the nucleic acid of (I); (3) a host cell comprising the host cell of (3) under conditions that allow synthesis of (I) and recovering (I) from the culture; (5) a composition comprising (I), or an antibody molecule produced by method (4); (6) a kit comprising (I), nucleic acid of (I), vector of (2) or host cell of (3); (7) optimising (I), or an antibody molecule produced by method (4); (6) a kit comprising (I), nucleic acid of (I), vector of (2) or host in submission comprising optimised clones; (I) and recovering (I), and formulating the composition, comprising optimisation of (I), and formulating the optimised antibody molecule with a carrier; and (12) a plarmaceutical composition prepared by method (8). (I) has plarmaceutical composition prepared by method (8). (I) has plarmaceutical composition for the prevention and/or reatment of a disease associated with antibody molecule may also be used in preparing a pharmaceutical composition for the disease mentioned above. The antibody is used for the amy also be used in preparing a disease associated with any also be used in preparing a disease associated with antibody molecule may also be used in preparing a disease associated with any and can be admitted by a disease mentioned above. The antibody is used for the disease mentioned above. The antibody is used for the disease mentioned above. The antibody is used for the dementa, Alzheimer's disease, metor neuropathy, Down's syndrome, admitted any old plateral solutions of present sequence is u

This invention describes novel antibodies that immunospecifically bind to B Lymphocyte Stimulator (BLyS) polypeptides. BLyS is a member of the tumour necrosis factor (TNF) super family and induces B cell proliferation and differentiation. The antibodies of the invention have cytostatic, immunosuppressive, immunostimulant, immunomodulatory, antirheumatic and antiALDS activity and can be used in vaccines to inhibit the expression and activity of BLyS. The antibodies bind to BLyS and so may be used to detect and quantitate the presence of BLyS in biological samples and may be used in this way to diagnose disease associated with aberrant expression of BLyS. They may also be administered to treat diseases associated with aberrant BLyS expression and activity such as cancer, immune, and autoimmune disorders and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        diseases, e.g. systemic lupus erythematosus, rheumatoid arthritis, immunodeficiency (GVID) and acquired immunodeficiency syndrome (AIDS)). ABP43990-ABP47228 represent the antibodies and fragments of the antibodies described in the method of
                                                                                                                                                                                                                                                                                      Antibodies against B Lymphocyte Stimulating polypeptides, useful for the diagnosis and treatment of cancers and immune disorders.

                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence represents an antibody variable heavy chain (VH) fragment. The fragment is used to produce a mixture or panel of 5 different specific binding members, each comprising an antibody VH and/or VL variable domain and capable, when displayed on the surface of filamentous bacteriophage particles or in the case of a specific binding member comprising the D5 VH and/or VL variable domain when bound to human service is useful for the selection of specific binding members with a desired property such as ability to cross BBB, ability to bind with a desired property such as ability to cross BBB, ability to bind intracellular adhesion molecules and to bind transferrin receptor. The antibodies are useful in diagnosis, prophylaxis and treatment of human or animal body, including neurological diseases, such as Alzheimer's disease, prion disease, AlDS-related dementia, epilepsy and traumatic brain injury and any diseases involving inflammation occurring within the

Patent No. 6407213

GENERAL INFORMATION:
APPLICANT: Carter, Paul J.
APPLICANT: Presta, Leonard G.
TITLE OF INVENTION: Method for Making Humanized Antibodies
NUMBER OF SEQUENCES: 26
CORRESPONDENCE ADDRESS:
ADDRESSEE: Genentech, Inc.
STREET: 1 DNA WAY
CITY: South San Francisco
